

# Annual Energy-Statistics 2021

Economic Research Department

# **Annual** / Energy-Statistics 2021

## About this statistical data book

This publication has been prepared by the Economic Research Department of Repsol with the aim to provide a tool that will aid objective analysis, discussion, and debate on energy markets. In this regard, the Energy Statistical Yearbook is available for access, both in Spanish and English, on the official Repsol website [[repsol.com](http://repsol.com)], and where it can also be downloaded in PDF and Excel formats. Further, this space provides interactive charts that may be viewed using Power BI.

The Energy Statistical Yearbook is an energy database with special emphasis on both the oil and natural gas sectors, as well as on electricity generation and sustainability indicators. It contains historical data relating to 50 countries and 10 geographical regions between 2005<sup>1</sup> and 2020 (the latest estimations). It represents the situation of the world energy sector covering more than 90% of global energy consumption.

Regarding the content and structure of this publication, firstly, it presents a brief analysis of the highlights of recent developments in the energy markets, including oil, natural gas and electricity, as well as CO<sub>2</sub> emissions at international level, as well as a special analysis of the energy sector in Spain.

The second section presents a statistical annex with detailed information on the following areas:

- Oil: proven reserves, production, consumption, and prices.
- Natural Gas: proven reserves, production, consumption, and prices.
- Electricity: gross generation and renewables share.
- CO<sub>2</sub> Emissions: emissions from fossil fuel combustion, intensity to GDP and emissions per capita.
- Primary Energy Intensity to GDP.

Finally, the Yearbook contains a dashboard for each region and country within the main magnitudes. Here you can find data on primary and final energy demand by both sources and sectors; total power generation and breakdown of sources; hydrocarbon consumption and foreign trade; and sustainability indicators.

In terms of methodology, estimations have been carried out using the most recent available data from various official sources (e.g., governmental, energy reference agencies, JODI and Bloomberg among others) following the same methodology as used by the International Energy Agency (IEA).

Data compilation, aggregation and validation has been made in collaboration with the consultancy firm ENERDATA ([www.enerdata.net](http://www.enerdata.net))

<sup>1</sup> For visualization purposes, this document only represents the years from 2011 onwards. You can find the whole period in the downloadable Excel file [<https://www.repsol.com/en/energy-and-innovation/energy-yearbook/index.cshtml>].

# Energy demand recent development

**The spread of COVID-19 at the beginning of 2020 has led to an unprecedented global health and economic crisis. The pandemic and the confinement measures taken to alleviate the health crisis represent the greatest disruptive phenomenon in the world economy since the end of World War II. In this way, the footprint that this pandemic has left on the energy variables are more than evident.**

Total primary energy demand decreased by 4% in 2020 to 13,828 million tonnes of oil equivalent (toe). Oil represented 30% of the primary energy consumed globally, the highest participation in the energy mix despite having suffered the greatest contraction in demand compared to 2019 among all energy sources, almost -9% year-on-year. Oil is followed by coal with 26% and natural gas with 24%.

Renewables were the only energy sources increasing demand in 2020. However, they also felt the aftereffects of the pandemic showing lower growth than in recent years. If we exclude hydroelectric and biomass, the rest of renewables experienced a growth compared to 2019 close to 14%, while in the previous ten years the growth was around 20%.

In 2020, OECD economies reduced demand by 7% year-on-year, with a dramatic drop in demand for coal and oil, 16% and 10%, respectively. Meanwhile, in the non-OECD demand contracted by 1.3%, with oil demand falling the hardest, almost 5%, while coal demand fell by 0.9%.

By sector, and as a natural consequence of the confinements, transport was the most affected, falling by 12.3% year-on-year and losing more than two percentage points of its weight in the global final consumption mix. On the other hand, the residential/commercial and industrial sectors experienced milder falls in their consumption of 1.2% and 1.5%, respectively.

Global energy intensity continued its positive trend –reducing intensity– in 2020, largely because the contraction in primary energy demand was greater than the contraction of the economy. However, there was divergence in regional terms, with the OECD's contribution to global dynamics being greater, since in the Non-OECD region this efficiency indicator increased.

# CO<sub>2</sub> emissions recent development

Closely linked to the economic and energy dynamics, CO<sub>2</sub> emissions in 2020 fell sharply compared to the previous year [about 5%]. A fall 8 times higher than that registered in 2009 due to the *subprime* crisis.

Regionally, the behavior was very different, and while in North America and Europe emissions fell by more than 10%, in Asia the reduction was a slight 1%. The reason was China, which was one of the few countries that increased its emissions and already emits more CO<sub>2</sub> than all the OECD countries combined.

On the opposite side we find the US as the country with the largest reduction in emissions in levels, while Spain was the one with the largest percentage reduction [-19% compared to 2019].

The picture is very different looking at other indicators, such as per capita emissions, where the Countries of the Persian Gulf continue to top the list. As an example, each Qatari generates almost 8 times more CO<sub>2</sub> than the world average. In the case of Spain, the fall in emissions has caused that during this 2020 per capita emissions are slightly below the global average [4.4 tons per inhabitant compared to the 4.5 t/hab global average].

Regarding to emissions intensity [emissions per unit of GDP], European countries continue to be the most efficient with their emissions, well below most large emitters, making emissions per dollar of GDP in the EU 45% below the world average. Within the EU, Spain is almost 15% below the European average. It should be noted that most countries have improved this indicator during the year 2020 indicating that, in this time of paralysis due to the pandemic, the reduction in emissions has been greater than the economic contraction.

# Oil market recent development

**Brent crude price averaged 42 dollars per barrel [\$/bl] in 2020, a sharp drop of 35% compared to the average price of 2019. The COVID-19 pandemic has led to an unprecedented crisis in the oil market.**

The health and economic crisis derived from the pandemic led the price of crude to evolve with great volatility. In April 2020 Brent prices, the global benchmark, traded below 20 \$/bl, a level not seen since the beginning of the century. At those critical moments, US benchmark crude WTI reached negative levels of -37 \$/bl for the first time in history. From then on, crude prices began a progressive upward trend, which took prices to 50 \$/bl at the end of the year. The levers that supported this trend are found in both supply and demand factors. On the supply side, and except for the response of the OPEC+ group in March 2020 when an agreement to attack the effects of the pandemic on demand was not reached, leading to a price war, the OPEC+ response was more agile than previous occasions and with had successful effects. The group agreed to cut a record 9.7 million bl/d in April 2020. And unlike the price shock that took place in 2015, when prices plummeted 47% vs. 2014, the group carried out and continues to carry out an exhaustive monitoring of the market in real time. As a result, the countries adhering to the agreement progressively relaxed production cuts to 7.7 million bl/d in December 2020. At the time of writing this report, OPEC+ countries agreed to increase production by 400 thousand bl/d on a monthly basis starting August to December, as well as extending the agreement until December 2022. This commitment is a sign of the group's willingness to rebalance the markets and, at the same time, support prices.

Regarding demand factors, the pandemic led to a drop in global oil demand of 8.7 million bl/d compared to 2019, the largest annual contraction in oil consumption the world has ever seen. The mobility restrictions imposed to stop the spread of the virus brought the global economy in general and oil demand in particular to a drastic halt. The second quarter of the year saw a sharp drop of 16 million bl/d, bringing global oil consumption to 2005 levels. The summer season, associated with greater mobility, underpinned oil consumption which increased by almost 10 million bl/d during the third quarter compared to the previous quarter. This made more evident the dynamics that oil demand follows in times of the COVID/19 pandemic: any relief of the effects of the pandemic through the relaxation of restrictive measures leads to an increase in mobility. This dynamic was accelerated with the appearance of the first vaccines against COVID-19 in November 2020. Brent prices, which by then averaged 43 \$/bl, started an upward trend that has led prices to average 73 \$/bl in June 2021.

Looking ahead, the evolution of oil prices will depend fundamentally on the evolution of the pandemic. In other words, increases in restrictions caused by the increase in the incidence of the virus, or problems related to vaccination programs may again lead to restrictions on mobility. And vice versa. Likewise, OPEC+'s production cuts agreement should support prices. As has been seen recently, the extension of the agreement until December 2022 is a representative sample of the commitment with the rebalancing of the oil markets, not only from the *de facto* leaders Saudi Arabia and Russia, but from the OPEC+ group as a whole.

# Natural gas market recent development

**The year 2020 was marked by the expansion of Covid-19 and the effects it had on economic activity and energy markets. As a result, natural gas prices fell sharply.** In the US, the Henry Hub averaged \$2.1/MMBtu in 2020, a level not recorded since the mid-90s, while Asian LNG (Japan Korea Marker) prices recorded their lowest level, 4.2 \$/MMBtu. In Europe, prices also plummeted, with main prices slightly above 3 \$/MMBtu.

On the demand side, global natural gas consumption fell by 48 Bcm. However, the share of gas in primary energy remained above 20%. The drops in gas demand vs 2019 were led by CIS (-18 Bcm), Europe (-16 Bcm) and South-Central America (-15 Bcm). These declines were partially offset by increases in the Middle East and Asia-Pacific (+5 Bcm and +4 Bcm, respectively). An earlier return to economic and industrial activity, allowed these regions to recover progressively normal levels of gas demand.

Despite this context, interruptions in the supply of gas (mainly in Asia-Pacific), the resumption of economic activity and different cold waves experienced in Asia and Europe at the end of the year, caused a strong rebound in demand and prices, which rocketed in 4Q20, offsetting the “bad numbers” of the previous quarters.

On the supply side, there were also contractions. By main producing regions, Russia led the fall with a production 6% lower than in 2019, about 47 Bcm less. Production also contracted in Europe, with the Netherlands leading the way, which reduced its production share by almost 10 Bcm year-on-year. With demand weakened and as gas prices fell below operating costs, production also fell in the US, even causing the cancellation of LNG cargoes. The average utilization rates of LNG facilities in this country began to decline in April last year, reaching a low of around 30-35% in mid-summer. Even so, with the recovery in 4Q21, U.S. LNG exports increased year-on-year, helped by the entry into operation of new LNG trains and capacity expansions in existing ones.

In summary, global gas production fell by 65 Bcm, surpassing the fall in demand, which helped to balance the natural gas market. Nowadays, Covid-19 is still active although the expansion of vaccination programs has prevented economic and industrial activity from being paralysed again. In fact, during the first half of 2021, the natural gas market has continued the path started at the end of 2020, with a tight market, strong Asian import appetite, low inventories in Europe and very high global prices. For the rest of the year, high price levels are expected to continue, even recovering average levels close to those seen in 2018.

# Power generation recent development

**The decline in economic activity in 2020 due to the coronavirus crisis caused the first contraction in global electricity generation since 2009 and, compared to the average growth of demand in the last decade of 3% per year, in 2020 there was a contraction of 0.6%.**

This reduction in demand, together with the new renewable generation capacity, caused the largest increase in the renewable's generation share in recent years on a global scale, increasing up to two percentage points (p.p) compared to 2019. Only wind increased its share by 0.7 p.p. while solar by 0.5 p.p. It should be noted that the share of generation with renewables - excluding hydroelectric and biomass - in the OECD reached 13.5% in 2020, while in the world it stood at 9.6%.

The only energy source that increased its share in global generation, besides renewables, was natural gas. The rest of the sources lowered their share, with coal being the most affected, falling almost 1.5 p.p. its share.

In the European Union [28] the contraction in electricity demand was much greater than in the rest of the world's major economies, registering a reduction of 4.5%, compared to -3.1% in the US or the 3.7% increase in electricity demand in China. Within the EU, Spain remained in the intermediate range, with a fall of 3.7%, while France and Germany recorded contractions of 6.7% and 6.5%.

# Spanish energy market recent development

**The reduction in commercial and industrial activity caused in Spain one of the largest contractions in oil consumption in the world [-18%] much higher than in the countries around us [the fall in the EU as a whole was 13%] and doubling the global average fall.**

Within petroleum products, it was diesel that recorded the largest correction in demand in levels. However, in percentage terms it was the kerosene who were most affected by the drastic stoppage of the aviation sector, which caused falls of more than 90% during the second quarter of the year. In the whole of the year, diesel increased its share to almost 60% of the Spanish product mix.

In the case of natural gas consumption, the Spanish system also suffered a significant contraction of 10%, compared to an average growth of 5% in the period 2015-2019. Most of this drop in demand was caused by the reduced need for gas for electricity generation.

The electricity market in Spain in 2020 was characterized by a sharp fall in prices, due to lower demand and the fall in gas prices, as well as the entry of new renewable generation capacity. Finally, prices in the wholesale electricity market averaged below 34 €/MWh during the year, the lowest value since 2004.

In 2020, nearly 3 GW of solar PV power and 1.8 GW of wind power were installed, offsetting the closure of nearly 4 GW of coal-fired generation capacity. With these new installations, solar capacity has multiplied by 2.5 in just two years, and wind has surpassed natural gas combined cycles, positioning itself as the technology with the highest installed capacity in the Spanish park.

In the share of generation by technology there is little change from the previous year. Nuclear continued to be the main source of generation, closely followed by wind power. While the presence of natural gas and coal was significantly reduced given that, faced with a scenario of contraction in demand, the technologies that stop producing are those with the highest operating costs.

Thus, the Spanish mix closed 2020 with 44% of renewable generation, improving 4 percentage points over the previous year, while emission-free generation amounted to 66%.

Consumption indicators for the first months of 2021 for petroleum products do not show a recovery in demand and continue 18% below that recorded in 2019 [with kerosene almost 75% below what was recorded pre-pandemic]. In the case of gas, direct consumption has practically recovered [it is 1.5% below 2019], however, the demand for gas for electricity generation is almost 24% below the levels of 2019, weighed down by high gas prices.

In the case of electricity, all historical price records have been broken during the beginning of 2021, but it wasn't only because of an extraordinary and punctual event, such as the snowfall of the Filomena storm, but it has come hand in hand with the increase in natural gas prices and CO<sub>2</sub> emissions. The price of the electricity pool until July has been above 63 €/MWh, 35% above the same dates of the 2015-2019 period. No price easing is expected in the coming months, as both European gas and CO<sub>2</sub> futures remain high. Even the intention on the part of the European Union to tighten up emissions targets causes a clearly upside risk in terms of the prices of emission rights, which have already stabilized comfortably above 50 €/t. But let us remember that the wholesale cost of electricity, even at these levels does not explain more than 40% of the final price, the rest are charges and taxes.

# Conversion factors

<b>Crude oil</b>					
To convert to:	tonnes	10 <sup>3</sup> litres	barrels	U.S. gallons	tonnes/year
<b>Multiply by:</b>					
tonnes	1.00	1.17	7.33	307.86	—
10 <sup>3</sup> litres	0.86	1.00	6.29	264.17	—
barrels	0.14	0.16	1.00	42.00	—
U.S. gallons	0.00	0.00	0.02	1.00	—
barrels per day	—	—	—	—	49.80

Note: based on worldwide average gravity.

<b>Products</b>				
To convert to:	barrels to tonnes	tonnes to barrels	10 <sup>3</sup> litres to tonnes	tonnes to 10 <sup>3</sup> litres
<b>Multiply by:</b>				
Liquefied petroleum gas (LPG)	0.1	11.5	0.5	1.8
Gasoline	0.1	8.3	0.8	1.3
Kerosene	0.1	7.8	0.8	1.2
Gas oil/Diesel	0.1	7.6	0.8	1.2
Fuel oil	0.2	6.6	1.0	1.0
Product basket	0.1	8.7	0.7	1.4

Note: Approximate conversion factors.

<b>Natural Gas an Liquefied Natural Gas (LNG)</b>					
To convert to:	Bcm NG	Bcf NG	Million toe	Million ton. LNG	Million boe
<b>Multiply by:</b>					
Bcm NG	1.0	35.3	0.9	0.7	6.6
Bcf NG	0.0	1.0	0.0	0.0	0.2
Million toe	1.1	39.2	1.0	0.8	7.3
Million ton. LNG	1.4	48.0	1.2	1.0	9.0
Million boe	0.2	5.4	0.1	0.1	1.0

Note:

Bcm = billion cubic meter

Bcf = billion cubic feet

toe = tonnes oil equivalent

boe = barrels oil equivalent

# Glossary

## Definitions

### **Primary Energy Demand**

Quantity of natural energy resources consumed in original state, at the site of production or elsewhere, or for later transformation into other forms.

### **Final Energy Consumption**

Difference between domestic demand and the consumption in energy transformations, and the losses involved. Final consumption measures the needs of the final consumers of the country. For oil, marine and aviation bunkers are excluded for countries.

### **Industry**

Includes the mining sector, manufacturing sector, construction and public works sector. It excludes the fuel consumption of all modes of transport, even those used by industry, and excludes energy products employed for non-energy uses [e.g. raw materials, lubricants]. It also excludes the fuel input for autoproduction and includes the autoproduced electricity.

### **Transport**

Includes all modes of transportation [ISIC Divisions 49 to 51], regardless of to whom they belong, and to what purpose the transport serves. Aviation and marine bunkers [international aviation and sea transport] are excluded, except at the world level.

### **Residential/Commercial**

Final consumption of energy products used for energy uses, excluding industry, transport, and agriculture sectors. ISIC Divisions 33, 36-39, 45-47, 53, 55, 56, 58-66, 68-75, 77-82, 84 [excluding class 8422], 85-88, 90-96 and 99 [for tertiary], and 97 and 98 [for residential].

### **CO<sub>2</sub> Emissions**

Emissions from combustion of mainly fossil fuels, estimated using the IPCC Reference Approach.

### **CO<sub>2</sub> Intensity to GDP**

Amount of CO<sub>2</sub> emitted to produce one unit of Gross Domestic Product [GDP]. In this publication it is presented in year 2015 real terms in purchasing power parity [ppp].

### **Primary Energy Intensity to GDP**

Primary energy consumed to produce one unit of Gross Domestic Product [GDP]. Non-energy uses are excluded. In this publication it is presented in year 2015 real terms in purchasing power parity [ppp].

### **Final Energy Intensity to GDP**

Final energy consumed to produce one unit of Gross Domestic Product [GDP]. Non-energy uses are excluded. In this publication it is presented in year 2015 real terms in purchasing power parity [ppp].

## Geographical grouping

### **European Union (UE28)**

Austria, Belgium, Bulgaria, Croatia, Republic of Cyprus, Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, Netherlands, Poland, Portugal, Romania, Slovakia, Slovenia, Spain, Sweden and United Kingdom.

### **OECD**

Australia, Austria, Belgium, Canada, Chile, Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Israel, Italy, Japan, Korea, Latvia, Luxembourg, Mexico, Netherlands, New Zealand, Norway, Poland, Portugal, Slovak Republic, Slovenia, Spain, Sweden, Switzerland, Turkey, United Kingdom and United States.

### **OPEC**

Algeria, Angola, Ecuador, Equatorial Guinea, Gabon, Iran, Iraq, Kuwait, Libya, Nigeria, Republic of the Congo, Saudi Arabia, United Arab Emirates and Venezuela.
