

Annual Energy-Statistics 2022

Economic Research Department

Annual / Energy-Statistics 2022

About this statistical data book

This publication has been prepared by the Economic Research Department of Repsol with the aim to provide a tool that will aid objective analysis, discussion, and debate on energy markets. In this regard, the Energy Statistical Yearbook is available for access, both in Spanish and English, on the official Repsol website [repsol.com], and where it can also be downloaded in PDF and Excel formats. Further, this space provides interactive charts that may be viewed using Power BI.

The Energy Statistical Yearbook is an energy database with special emphasis on both the oil and natural gas sectors, as well as on electricity generation and sustainability indicators. It contains historical data relating to 50 countries and 10 geographical regions between 2005¹ and 2021 [the latest estimations]. It represents the situation of the world energy sector covering more than 90% of global energy consumption.

Regarding the content and structure of this publication, firstly, it presents a brief analysis of the highlights of recent developments in the energy markets, including oil, natural gas and electricity, as well as CO₂ emissions at international level, as well as a special analysis of the energy sector in Spain.

The second section presents a statistical annex with detailed information on the following areas:

- Oil: proven reserves, production, consumption, and prices.
- Natural Gas: proven reserves, production, consumption, and prices.
- Electricity: gross generation and renewables share.
- CO₂ Emissions: emissions from fossil fuel combustion, intensity to GDP and emissions per capita.
- Primary Energy Intensity to GDP.

Finally, the Yearbook contains a dashboard for each region and country within the main magnitudes. Here you can find data on primary and final energy demand by both sources and sectors; total power generation and breakdown of sources; hydrocarbon consumption and foreign trade; and sustainability indicators.

In terms of methodology, estimations have been carried out using the most recent available data from various official sources [e.g., governmental, energy reference agencies, JODI and Bloomberg among others] following the same methodology as used by the International Energy Agency (IEA).

Data compilation, aggregation and validation has been made in collaboration with the consultancy firm ENERDATA (www.enerdata.net).

¹ For visualization purposes, this document only represents the years from 2012 onwards. You can find the whole period in the downloadable Excel file [<https://www.repsol.com/en/energy-and-innovation/energy-yearbook/index.cshtml>].

Energy demand recent development

After a dramatic year 2020 for the energy markets caused by the COVID-19 pandemic, which led to an unprecedented health and economic crisis on a global scale, advances in vaccination programs, the progressive lifting of restrictions associated with the pandemic and the consequent reactivation of mobility and economic activity led to a recovery in energy demand in 2021.

Total primary energy consumption increased by 5%, reaching 14,555 million tons of oil equivalent (toe). Oil contributed about 30% of the primary energy consumed globally, followed by coal with 27% and natural gas with 24%.

Renewable energies continued their expansion in 2021, since they were the only energy sources that expanded their demand in 2020. Excluding hydro and biomass, the group other renewables registered an increase of 17%. Despite this, other renewables represented only 2% of the total primary energy consumed globally in 2021.

By regions, in 2021 OECD economies increased their primary energy demand by 4% compared to the previous year, partially recovering a spectacular 7% drop in demand in 2020, especially for coal and oil. For its part, non-OECD demand expanded by 5.3%, with the group of other renewables being the primary energy source that registered the greatest expansion, 29%. Over the course of the last 10 years, other renewables have increased its primary energy demand globally by nine times in non-OECD economies, versus by three times in OECD countries.

By sectors, the progressive lifting of mobility restrictions and the economic recovery led the transport sector to grow by 7.5%, partially offsetting the 12.3% drop of 2020. For its part, the residential/commercial and the industrial sectors experienced more modest increases in consumption, 4.2% and 3.6% year-on-year, respectively.

Energy intensity, or the energy needed to produce a unit of gross domestic product, continued its positive trend –i.e. intensity reduction– at a global scale in 2021, largely because the expansion of primary demand was lower than the expansion of the economy. During the last 10 years, global energy intensity has decreased by 15%. A similar trend followed the economies of both the OECD and non-OECD regions.

CO₂ emissions recent development

After the economic slowdown linked to the 2020 lockdowns, CO₂ emissions increased sharply [more than 5%] until reaching a new all-time high in 2021, almost 1% above the 2019 level.

The behavior between the different countries and regions has been very different. In North America and Europe emissions remain below pre-pandemic levels while in Africa and Asia emissions are 4% above 2019. The US is the country that has observed the greatest reduction in emissions mainly due to lower oil consumption. China, on the other hand, has seen strong growth in emissions through its increased use of coal. China emissions now exceed more than one third of global CO₂ emissions.

The picture is very different when analyzing other indicators, such as per capita emissions, where the Persian Gulf countries continue to top the list. As an example, each Qatari generates almost 8 times more CO₂ than the world average. In the case of Spain, the increase in emissions during 2021 has been in line with the world average, so per capita emissions continue to be slightly above the global average (4.9 tons per inhabitant compared to 4.7 tons per inhabitant for the global average).

Regarding the intensity of emissions (emissions over GDP), European countries continue to be the most efficient with their emissions, well below most of the large emitters. Emissions for each dollar of GDP in the EU are 40% below the world average. Spain recorded a level more than 10% below the European average. However, this indicator has highlighted very particular situations in the EU during 2021, where the increase in gas prices in the second half of the year has caused both lower economic growth and increased use of coal [especially in Germany and Poland]. This caused the intensity of emissions to increase for the first time since 2010.

Oil market recent development

In 2021, the price of Brent crude oil averaged 71 dollars per barrel [\$/bbl], an increase of 68% compared to the average price of 2020. After the sharp drop in prices registered in 2020 caused mainly by the COVID-19 pandemic, oil prices increased after the rollout of vaccination programs. The subsequent recovery in economic activity and the reactivation of mobility at a global level, strongly boosted the demand for oil products, which translated into a sustained increase of oil prices.

Even though prices began the year below \$50/bbl, the start of vaccination campaigns, especially in countries such as the United States and some European countries, laid the foundations for a solid economic recovery. As a result of the protection against contagion, the vaccines managed to counteract the negative impact on oil demand caused by lockdowns and different mobility restriction measures whose main objective was the prevention of contagion. At the beginning of March 2021, Brent prices were quoted above \$65/bbl, an increase of 30% in just three months. As the months went by, this trend only strengthened, placing oil prices around \$75/bbl. However, an increase in infections globally, saw prices falling back below \$65/bbl by the end of August.

However, prices underwent a solid and sustained increase to around \$80/bbl by mid-November. The main elements that underpinned this upward trend were [i] additional demand for oil for electricity generation derived from a very strong increase in natural gas prices; [ii] the OPEC+ group, led by Saudi Arabia and Russia as *de facto* leaders, which agreed to begin reversing the historic 9.7 mb/d cuts implemented in March 2020. The cartel's policy of gradually ramping up production considered market fundamentals very carefully, which were torn between a strong economic recovery and the effect of the COVID-19-related lockdowns.

Between mid-November and the end of the year, prices fell sharply to around \$65/bbl due to the emergence of the new omicron variant, which was responsible for an explosion of infections worldwide.

In 2022, at the time of writing, the event that is shaking energy markets in general, and oil markets in particular, is Russia's invasion of Ukraine. Prices reached \$139/bbl at the beginning of March due to fears of an abrupt drop in the supply of Russian oil to international markets. So far, Russia has managed to divert part of its exports of crude oil and products from Europe to Asia, China and India. Although it is still too early to ensure that this change in oil trade ceases to be circumstantial and becomes structural. In June 2022, the European Council agreed to gradually ban the purchase, import or transfer of crude oil and certain Russian oil products. In this way, the restrictions will be applied gradually: within six months for crude oil, and eight months for other refined petroleum products. Since most of the Russian oil supplied to the EU is of marine origin, by the end of the year these restrictions will cover almost 90% of Russian oil imports to Europe.

Natural gas market recent development

In 2021, the evolution of the global natural gas market was marked by two important milestones. The first was the recovery of gas demand compared to 2020, which came hand in hand with the recession of the pandemic and the recovery of economic activity. This recovery was progressive and noticeable throughout the year. The second was a very strong adjustment of the global natural gas balance concentrated in the last quarter of 2021 and whose effects are expected to continue for at least the next two years. The reason: the escalation of geopolitical tension with Russia and the subsequent start of the war on February 24th, 2022, morally abominable and absolutely disruptive for the dynamics of the global gas market.

Returning to what happened in 2021, on the demand side, the global consumption of natural gas increased by more than 190 Bcm, surpassing even the figures reached in 2019 and standing at about 4,170 Bcm. The recovery in demand was globally experienced, although the 6% year-on-year increase in Asia-Pacific and Europe, accounted in net figures for almost 45% of growth vs 2020. The rest of the growth came hand in hand with demand from the countries of the ex-Soviet bloc, with Russia leading the way. The main reason in this case was not only the recovery of economic activity, but also the need to face a cold winter that triggered domestic consumption of natural gas, a reason that Russia used afterwards to prioritize the refilling of gas in storage instead of exporting it. This worsened relations with Ukraine and the rest of Europe.

On the supply side, there was also a relevant increase with a growth in world production of 4% vs 2020, standing above 4,100 Bcm. The main contributions came from Russia, China, Algeria, and the USA. The reasons were diverse: on the one hand, to cover domestic demand itself, especially in China, and on the other hand, to maximize exports in a bullish price environment that reached very high levels during the last quarter of 2021, as a result of the rebound in seasonal demand [winter] and the growing pre-war tensions with Russia.

The tension in the gas market resulted in rising prices that, on average, increased fivefold in Europe [TTF and NBP], where demand experienced a strong uptick and production continued to decline [4% less than in 2020]. In Asia [JKM], price peaks were also seen, since to cover domestic demand, it was necessary to compete with Europe to attract gas. Only in North America [HH] the price remained limited and under the influence of domestic dynamics.

Currently, the situation is complex. While different variants of Covid-19 continue to paralyze key countries in terms of gas demand such as China, everything has taken a back seat after the outbreak of war between Russia and Ukraine this year.

Europe's need to minimize dependence on Russian gas in a few months is redefining the dynamics of global gas. This is reflected in a extremely high volatility of prices that beat themselves recurrently, reaching new historical highs, and in the application of policies that, at least in Europe, are aimed at replacing Russian supply and limiting the demand for gas. All with clear repercussions in the Asian region, very dependent on gas imports like Europe still is.

At the moment of writing, it is impossible to predict how prices will behave in the short term, but it can be anticipated that they will remain high and the global gas balance tight, at least in the coming year. How much? That will depend on Europe's ability to become "independent" from Russian gas and how cold next winter will be.

Power generation recent development

After the impact on economic activity derived from the health crisis caused by COVID-19, the progress in vaccination programs at the beginning of 2021 laid the foundations for a solid recovery of the economy and, therefore, of the demand for energy. In the case of electricity generation worldwide, this expansion of economic activity led to an increase in electricity production of 5.5% compared to the average level in 2020. The annual growth in 2021 is the highest since 2010 and doubles the average annual growth of the 2009-2019 decade [2.7%].

The installation of renewable generation increased proportionally to that of electricity generation. In this way, the share of renewable energies in the generation mix at a global level remained at 28.1%, without changes compared to the 2020 share.

By source of electricity generation, coal, oil, wind and solar were the energy sources that increased their share in global electricity generation, to the detriment of a lower share of natural gas and hydroelectric power.

By region, the share of renewable energies in electricity generation in the OECD reached 30.3% in 2021, compared to 26.6% in non-OECD countries. Despite the fact that in the OECD region the share of renewable generation in the electricity generation mix averaged 22.3% in the 2009-2019 decade, while the non-OECD economies, as a whole, averaged 22.9%, developed countries have increased their renewable share significantly in recent years. If in 2019 the renewable share in the OECD region stood at 27.3%, in 2020, despite the pandemic, it increased to 30.1%, an increase of three percentage points [p.p.], compared to one p.p. in non-OECD economies. In 2021, only advanced economies increased their renewable share [+0.3 p.p.], compared to -0.1 p.p. in non-OECD economies.

In the European Union [27] the expansion of electricity demand [+3.7%] was lower than the global electricity demand [5.5%] and that of China [+9.7%], but it was above of the demand growth in the United States [2.7%]. Within the EU, electricity demand in Spain grew at a level like that of the EU [+3.4%], above the demand in Germany [+1.9%], although lower than that of France [+4.3%].

Spanish energy market recent development

The recovery of commercial and industrial activity saw Spain oil consumption increase by 9% in 2021, after the sharp fall [18%] observed the previous year. It exceeded growth observed in the rest of Europe [5%] and in the world [6%].

Within petroleum products, it was jet aviation that registered the largest upward correction in demand [38%] due to the recovery in the activity of the aviation sector. That was followed by gasoline [23%, both largely offsetting the falls registered in the consumption of heating oil and LPG [20% and 16%, respectively]. However, over the whole year, diesel was the product that increased its share the most, exceeding 60% of the Spanish product mix.

In the case of natural gas consumption, a significant recovery was also registered, reaching a year-on-year growth of 6%, in line with the European figures and slightly above the average registered in the world. By sector, despite the consumption of gas for power production fell, an increase in the consumption of the industrial sector offset this fall. The other sectors did not show significant changes to consumption.

The electricity market in Spain in 2021 was characterized by an incipient rise in prices that would materialize afterwards, due to: a greater demand and the sharp rise in gas prices registered during the last quarter of the year.

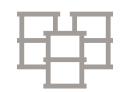

In the share of generation by technology, a strong increase was observed in the contribution of solar [29%] and wind [10%]. Despite this, gas was again the one that registered a greater contribution in net terms to the power mix [above 25%, followed by wind and nuclear, both above 20%].

In this way, the Spanish mix closed 2021 with renewable energy contributing more than 60% in the power mix, significantly improving the data of the previous year.

At the beginning of 2021, electricity saw all historical price records being broken. This was a result one in 100-year storm Filomena but also because of the increase in natural gas prices and CO₂ emission prices. As for 2022, the price of the electricity pool during the first quarter soared with prices exceeding €200/MWh. It then relaxed to €143/MWh in July, still very high levels by historic levels.

For the coming months, an environment of high prices is expected to continue given the uncertainty in Europe as a result of the war initiated by Russia.

Statistical annex

Product basket	0.1	8.7	0.7	1.4

Note: Approximate conversion factors.

Natural Gas an Liquefied Natural Gas (LNG)					
To convert to:	Bcm NG	Bcf NG	Million toe	Million ton. LNG	Million boe
Multiply by:					
Bcm NG	1.0	35.3	0.9	0.7	6.6
Bcf NG	0.0	1.0	0.0	0.0	0.2
Million toe	1.1	39.2	1.0	0.8	7.3
Million ton. LNG	1.4	48.0	1.2	1.0	9.0
Million boe	0.2	5.4	0.1	0.1	1.0

Note:

Bcm = billion cubic meter

Bcf = billion cubic feet

toe = tonnes oil equivalent

boe = barrels oil equivalent

Glossary

Definitions

Primary Energy Demand

Quantity of natural energy resources consumed in original state, at the site of production or elsewhere, or for later transformation into other forms.

Final Energy Consumption

Difference between domestic demand and the consumption in energy transformations, and the losses involved. Final consumption measures the needs of the final consumers of the country. For oil, marine and aviation bunkers are excluded for countries.

Industry

Includes the mining sector, manufacturing sector, construction and public works sector. It excludes the fuel consumption of all modes of transport, even those used by industry, and excludes energy products employed for non-energy uses [e.g. raw materials, lubricants]. It also excludes the fuel input for autoproduction and includes the autoproduced electricity.

Transport

Includes all modes of transportation [ISIC Divisions 49 to 51], regardless of to whom they belong, and to what purpose the transport serves. Aviation and marine bunkers [international aviation and sea transport] are excluded, except at the world level.

Residential/Commercial

Final consumption of energy products used for energy uses, excluding industry, transport, and agriculture sectors. ISIC Divisions 33, 36-39, 45-47, 53, 55, 56, 58-66, 68-75, 77-82, 84 [excluding class 8422], 85-88, 90-96 and 99 [for tertiary], and 97 and 98 [for residential].

CO₂ Emissions

Emissions from combustion of mainly fossil fuels, estimated using the IPCC Reference Approach.

CO₂ Intensity to GDP

Amount of CO₂ emitted to produce one unit of Gross Domestic Product [GDP]. In this publication it is measured in terms of purchasing power parity [ppp].

Primary Energy Intensity to GDP

Primary energy consumed to produce one unit of Gross Domestic Product [GDP]. Non-energy uses are excluded. In this publication it is measured in terms of purchasing power parity [ppp].

Final Energy Intensity to GDP

Final energy consumed to produce one unit of Gross Domestic Product [GDP]. Non-energy uses are excluded. In this publication it is measured in terms of purchasing power parity [ppp].

Geographical grouping

European Union (EU27)

Austria, Belgium, Bulgaria, Croatia, Cyprus, Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, Netherlands, Poland, Portugal, Romania, Slovakia, Slovenia, Spain, Sweden.

OECD

Australia, Austria, Belgium, Canada, Chile, Colombia, Costa Rica, Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Israel, Italy, Japan, Latvia, Lithuania, Luxembourg, Mexico, Netherlands, New Zealand, Norway, Poland, Portugal, South Korea, Slovakia, Slovenia, Spain, Sweden, Switzerland, Turkey, United Kingdom, United States.

OPEC

Algeria, Angola, Ecuador, Equatorial Guinea, Gabon, Iran, Iraq, Kuwait, Libya, Nigeria, Republic of the Congo, Saudi Arabia, United Arab Emirates, Venezuela.
