

Annual Energy-Statistics 2023

Economic Research Department

Annual / Energy-Statistics 2023

About this statistical data book

This publication has been prepared by the Economic Research Department of Repsol with the aim to provide a tool that will aid objective analysis, discussion, and debate on energy markets. In this regard, the Energy Statistical Yearbook is available for access, both in Spanish and English, on the official Repsol website [repsol.com], and where it can also be downloaded in PDF and Excel formats. Further, this space provides interactive charts that may be viewed using Power BI.

The Energy Statistical Yearbook is an energy database with special emphasis on both the oil and natural gas sectors, as well as on electricity generation and sustainability indicators. It contains historical data relating to 50 countries and 10 geographical regions between 2005¹ and 2021 [the latest estimations]. It represents the situation of the world energy sector covering more than 90% of global energy consumption.

Regarding the content and structure of this publication, firstly, it presents a brief analysis of the highlights of recent developments in the energy markets, including oil, natural gas and electricity, as well as CO₂ emissions at international level, as well as a special analysis of the energy sector in Spain.

The second section presents a statistical annex with detailed information on the following areas:

- Oil: proven reserves, production, consumption, and prices.
- Natural Gas: proven reserves, production, consumption, and prices.
- Electricity: gross generation and renewables share.
- CO₂ Emissions: emissions from fossil fuel combustion, intensity to GDP and emissions per capita.
- Primary Energy Intensity to GDP.

Finally, the Yearbook contains a dashboard for each region and country within the main magnitudes. Here you can find data on primary and final energy demand by both sources and sectors; total power generation and breakdown of sources; hydrocarbon consumption and foreign trade; and sustainability indicators.

In terms of methodology, estimations have been carried out using the most recent available data from various official sources [e.g., governmental, energy reference agencies, JODI and Bloomberg among others] following the same methodology as used by the International Energy Agency (IEA).

Data compilation, aggregation and validation has been made in collaboration with the consultancy firm ENERDATA (www.enerdata.net).

¹ For visualization purposes, this document only represents the years from 2013 onwards. You can find the whole period in the downloadable Excel file [<https://www.repsol.com/en/energy-and-innovation/energy-yearbook/index.cshtml>].

Energy demand recent development

In 2022, high energy prices and rising food prices led to an increase in inflation levels not seen in decades. Prices had already been climbing due to the economic rebound after the pandemic, as well as disruptions in supply chains caused by lockdowns. However, inflation skyrocketed worldwide following the Russian invasion of Ukraine and the resulting war.

The increase in prices caused a reduction in purchasing power, which harmed consumers throughout 2022. Additionally, that same year, central banks around the world began a policy of raising interest rates to curb inflation and anchor inflation expectations in their economies. Thus, the tightening of monetary policy, the adjustment of household real income, and the decline in confidence led to slower economic growth during 2022, at 3.5% compared to the 6.3% recorded in 2021, according to data from the International Monetary Fund.

This economic context resulted in a global slowdown in energy consumption, reaching 2% in 2022 after growing by 5% in 2021. This trend, which can be considered a significant adjustment following the strong demand surge experienced in 2021 associated with the end of strict lockdowns and the deployment of vaccines, is still a notable growth in relative terms. The average annual growth of global energy consumption during the pre-pandemic period of 2015-2019 was 1.7%, three tenths below the growth recorded in 2022. In other words, in 2022, the growth in global energy demand was more dynamic than before the pandemic, despite the context of war and sustained increase in energy prices. To give an idea of this last point, in the case of oil, the average price in 2022 was almost double the average during the pre-pandemic period of 2015-2019.

The 2% of growth in 2022 led to total primary energy demand reaching 14,951 million tonnes of oil equivalent [toe]. Oil contributed 30% of the primary energy consumed globally, followed by coal at 27% and natural gas at 23%. Renewable energies continued their expansion in 2022. If we exclude hydroelectric and biomass, the rest of the renewables saw a 17% increase, although they accounted for only 2% of the total primary energy consumed globally.

By regions, in 2022, the OECD contracted its demand for primary energy by 0.6%, after having increased by almost 5% in 2021, with consumption falling for all energy sources except for oil, biomass, and other renewables. Meanwhile, in non-OECD countries, demand expanded by 3.4%, with consumption only declining for natural gas and nuclear. It is worth noting the decline in natural gas consumption in both regions, due to the sharp increase in prices: both in Europe and Asia, the average gas price in 2022 was twice that of oil.

In terms of sectors, transportation once again experienced solid growth, with a 5% increase in energy demand. Meanwhile, the residential/commercial and industrial sectors saw more modest increases, at 1.9% and 1.1% respectively. Energy intensity [i.e., the energy needed to produce one unit of gross domestic product] continued its positive trend -a reduction in intensity-globally in 2022, largely because the expansion of primary demand was lower than the expansion of the economy. Over the past 10 years, global energy intensity has been reduced by nearly 15%. Similar trends have been followed by both the OECD and non-OECD economies.

CO₂ emissions recent development

CO₂ emissions increased by just over 2.6% to reach a new record high in 2022.

For the second consecutive year, the growth of emissions was of the same order of magnitude as global economic growth, something that had not happened in the past decade, when economic development always outpaced the growth of emissions, responding to efforts to decarbonize economies.

The high price of natural gas in 2022 forced many countries to shift their consumption towards coal, which led to a decline in emissions from gas consumption, something that had only been seen in years of economic crises in recent years. Similarly, emissions from coal combustion experienced one of the highest annual growth rates in recent years, reaching a new historical peak, surpassing the levels of 2014.

The behavior of different countries and regions has been very different, and while emissions in the European Union have fallen in response to a slowdown in industrial activity, in the United States, the increased consumption of natural gas offset the reduced use of coal and resulted in an increase in emissions. In the case of Spain, the trend has been opposite to that of its neighboring countries, and emissions have increased due to higher consumption of oil and coal.

India and Indonesia saw the largest increases in emissions, both due to the growth of the industry based on coal-fired power generation, while China remains the country with the highest emissions [accounting for 33% of global emissions].

The situation is very different when analyzing other indicators such as per capita emissions, where Gulf countries continue to top the list. For example, each Qatari generates seven times more CO₂ than the global average. In Spain, the increase in emissions during 2022 has been slightly above the global average, so per capita emissions continue to be slightly higher than the global average [5.3 tons per person compared to the global average of 4.9 tons per person].

Regarding emissions intensity [emissions per unit of GDP], European countries continue to be the most efficient with their emissions, well below the majority of major emitters. Since the EU economy grew in 2022 while emissions decreased, this indicator has improved compared to the previous year, and now emissions per dollar of GDP in the EU are 44% below the global average.

Oil market recent development

The price of the global benchmark Brent crude reached an average of \$101 per barrel [\$/bbl] in 2022, the highest annual average price since 2013. This represents an increase of over 40% compared to the 2021 average of \$71/bbl.

The high prices were primarily observed in the first half of the year, initially in response to a recovering demand as economies reopened after the impact of COVID-19, and due to production restrictions imposed by major oil producers. However, it was after Russia's invasion of Ukraine that market uncertainty intensified, with the focus shifting to supply availability, leading Brent to reach a peak of \$128/bbl in early March 2022. Prices remained at a high level until mid-year, when they gradually declined as concerns about a recession weighed on the market. Brent averaged just over \$82/bbl in December 2022, similar to the January 2022 average of \$85/bbl.

In 2022, global demand for petroleum products increased by slightly over 2 million barrels per day [mb/d] to nearly 100 mb/d, approaching the pre-pandemic level of 100.8 mb/d in 2019. The demand growth was largely driven by aviation fuel, supported by the recovery in air transportation following the pandemic. Growth in other product segments continued in 2022, albeit at a slower pace. Global diesel consumption growth declined from 1.5 mb/d in 2021 to 0.66 mb/d in 2022, reflecting weakened economic activities. Naphtha, after a strong growth year in 2021, decreased by 0.13 mb/d due to weakness in the petrochemical sector.

Regionally, growth was largely driven by non-OECD markets, particularly the Middle East and India. Chinese demand decreased by around 0.4 mb/d as closures in the country impacted demand. Among OECD markets, European growth was particularly weak. While high gas prices prompted a shift from gas to oil, this was largely offset by weakness in the petrochemical sector, which had to cope with high energy costs.

World oil production increased to 100 million b/d in 2022, up by 4.6 mb/d compared to 2021. The production increase was concentrated in Saudi Arabia and the United States. Saudi Arabia supplied 1.4 mb/d more than in 2021, approximately half of OPEC's supply growth. Outside of OPEC, the U.S. added 1.2 mb/d, accounting for around 60% of non-OPEC growth. During the third quarter, doubts arose about whether OPEC would increase production at the pace of demand recovery, as several member countries were producing below their quotas. In November, OPEC reintroduced production cuts of 2 mb/d in anticipation of a potential surplus in case of worsening economic conditions.

The Russian invasion of Ukraine has significant implications for global crude and petroleum product supply. Prior to the invasion, Russian production was expected to increase by over 0.8 mb/d in 2022, according to the International Energy Agency (IEA). However, actual production growth was only around 0.2 mb/d due to OECD market sanctions. The global trade flow of crude and products also shifted as Russian production sought destinations in non-OECD countries.

The market in 2023 has been influenced by supply constraints and the risk of recession in OECD economies, particularly in Europe. China's reopening to focus on economic growth is providing support to global oil demand. The main supply-side uncertainty is Russian ability to overcome an embargo¹ on its crude and petroleum products, since OPEC, leaded by Saudi Arabia, seems highly committed with production cuts.

¹ The EU embargo and the G7 price caps on Russian crude came into effect in early December 2022. The embargo and limitations on prices for Russian petroleum products did it in February 2023.

Natural gas market recent development

The global natural gas market suffered a shock in 2022, when Russia substantially cut pipeline supplies to Europe, adding unprecedented pressure on gas markets, and triggering a global energy crisis.

Despite this, Europe was able to offset the lack of Russian supply and gas storage infrastructures could be filled well above historical averages. The main reasons were, on the one hand, mild temperatures, and on the other hand, a combination of policy measures, a record inflow of liquefied natural gas (LNG) and a sharp drop in demand, especially in highly energy-intensive industries.

The reduction in Russian supply also had implications for other consuming regions beyond Europe, leading to an environment of exorbitant prices, supply tensions and a significant reduction in demand.

Global gas consumption fell 1.5% year-on-year in 2022, a similar drop to that experienced in 2020 after the first wave of COVID-19 lockdowns. Most of the reduction in demand was concentrated in the main European and Asian import markets. The sharp increase in gas prices supported the dynamics of the switch from gas-to-coal in the power sector and depressed the use of gas in energy-intensive industries. The measures to improve energy efficiency and the continuous deployment of renewable energies, reduced the demand for gas in a structural way.

The war in Ukraine highlighted the fragility of the global gas balance and the need to prioritize security of supply. Gas import markets remained exposed to a tight supply environment and the impact of possible further cuts in Russian supply. This was a concern for much of the year.

Governments in Europe and other importing markets took policy steps to increase their energy resilience and reduce reliance on natural gas. This gave a strong boost to the business and commercialization of LNG.

LNG demand was dominated by a sharp increase in LNG imports received in Europe, which was balanced by a sharp drop in the rest of the world, particularly Asia. While the US supplied about two-thirds of the LNG to Europe, other "alternative suppliers" redirected significant volumes to the European market: Qatar, Egypt, Norway, Angola, Russia, and Trinidad and Tobago, which provided most of the remaining third.

Regarding to the Asian basin, the year was marked by strong competition with Europe to attract gas, which raised prices substantially. But once the comfort point was reached in order to face the winter, a gradual rebalancing process began in the market which has been maintained in the first months of 2023.

As a result of this, the prices of the main global gas markers (Northeast Asia, North America, and Europe) fell by close to 70% between mid-December and the end of 1Q23, while the levels of stored gas ended the heating season well above their five-year averages.

In the short term, the accessibility of gas, healthy gas storage levels and the persistence of weak demand, are reasons for cautious optimism regarding the security of supply. However, this confluence of factors should not distract us from taking the additional measures needed to mitigate potential risks that could quickly reignite market tensions and price volatility.

Power generation recent development

In 2022, worldwide electricity generation increased with the improvement of the economy, reaching an annual growth in line with the average of the last decade [2.3%] and marking a new historical high.

The installation of new wind and solar generation capacity resulted in an increase in the percentage of renewable generation in the electricity generation mix, reaching almost 30% of global generation in 2022, surpassing the previous year's figure by 1.5 percentage points. Currently, wind and solar generation represent only 7% and 4% of electricity production, but they have nearly doubled their production in just 5 years. Among renewable sources, hydroelectric power remains the most important, maintaining a generation share of around 16%, in line with previous years.

Conventional thermal generation also achieved several milestones. Electricity generated from coal reached a historical high, as did gas-generated electricity, despite the high price of raw materials. Oil-based generation, which is much lower in volume compared to other fossil fuels and has historically been decreasing, reached its highest level in the last 5 years and has seen two consecutive years of increase.

Distinguishing by regions, emerging countries are installing more renewable capacity. However, since they are also installing thermal generation capacity, the percentage of renewable generation in the generation mix of OECD countries is growing faster than in emerging ones.

The European Union has managed to increase its renewable generation, reaching a maximum of nearly 40% in the generation mix, a figure much higher than the OECD average.

It is worth noting the case of China, where the largest renewable capacity is being installed by far. For the first time, China has surpassed a 30% share of renewable generation.

Spanish energy market recent development

Spanish economic recovery in 2022 led to an 8% increase in oil consumption. However, it remains far from recovering the levels seen before the pandemic.

This increase in petroleum product consumption has been driven by the transportation sector, which has shown the highest growth [8%], while other sectors have exhibited more modest increases, especially the industry and agriculture.

Aviation fuel stands out among petroleum products, with demand increasing by 75% compared to 2021. However, it has not yet reached the level of 2019, as neither the number of flights nor the number of passengers transported have recovered either.

The trend in land transportation fuels remains consistent with recent years, with gasoline continuing to gain importance over diesel. In 2022, gasoline consumption increased by 10%, reaching the highest level since 2010, while diesel growth was only 2% and its level remains below that of 2019. Despite this gasoline growth, diesel still accounts for 79% of automotive fuel consumption. On a much smaller scale, automotive LPG increased by 24%, surpassing all previous records.

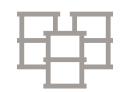

Natural gas consumption in Spain varied significantly depending on the consumer. Gas for conventional uses responded to the skyrocketing prices by falling more than 20% compared to the previous year, reaching minimum levels since 2007. Within this sector, industrial consumption experienced a much greater decline than domestic consumers and small and medium-sized enterprises. On the other hand, gas used for electricity generation increased by over 50% due to regulatory changes that allowed it to remain largely unaffected by prices [the Consumer Adjustment Mechanism, which operated during the second half of the year].

This temporary regulation of the electricity market led combined-cycle plants to generate 50% more energy than the previous year, making Spain a net electricity exporter through its exchanges with France [which was also experiencing issues with its nuclear generation].

The electricity generation system continues to add new renewable generation capacity. Installed solar photovoltaic power increased by 30% and solar power by 5%, while generation capacity with coal was phased out.

Despite this new renewable capacity, the increased use of gas resulted in an increase in emissions from the electricity system, as the percentage of generation from non-CO₂ emitting sources decreased to 63% [down from 68% the previous year].

Statistical annex

Conversion factors

Crude oil					
To convert to:	tonnes	10 ³ litres	barrels	U.S. gallons	tonnes/year
Multiply by:					
tonnes	1.00	1.17	7.33	307.86	—
10 ³ litres	0.86	1.00	6.29	264.17	—
barrels	0.14	0.16	1.00	42.00	—
U.S. gallons	0.00	0.00	0.02	1.00	—
barrels per day	—	—	—	—	49.80

Note: based on worldwide average gravity.

Products				
To convert to:	barrels to tonnes	tonnes to barrels	10 ³ litres to tonnes	tonnes to 10 ³ litres
Multiply by:				
Liquefied petroleum gas (LPG)	0.1	11.5	0.5	1.8
Gasoline	0.1	8.3	0.8	1.3
Kerosene	0.1	7.8	0.8	1.2
Gas oil/Diesel	0.1	7.6	0.8	1.2
Fuel oil	0.2	6.6	1.0	1.0
Product basket	0.1	8.7	0.7	1.4

Note: Approximate conversion factors.

Natural Gas an Liquefied Natural Gas (LNG)					
To convert to:	Bcm NG	Bcf NG	Million toe	Million ton. LNG	Million boe
Multiply by:					
Bcm NG	1.0	35.3	0.9	0.7	6.6
Bcf NG	0.0	1.0	0.0	0.0	0.2
Million toe	1.1	39.2	1.0	0.8	7.3
Million ton. LNG	1.4	48.0	1.2	1.0	9.0
Million boe	0.2	5.4	0.1	0.1	1.0

Note:

Bcm = billion cubic meter

Bcf = billion cubic feet

toe = tonnes oil equivalent

boe = barrels oil equivalent

Glossary

Definitions

Primary Energy Demand

Quantity of natural energy resources consumed in original state, at the site of production or elsewhere, or for later transformation into other forms.

Final Energy Consumption

Difference between domestic demand and the consumption in energy transformations, and the losses involved. Final consumption measures the needs of the final consumers of the country. For oil, marine and aviation bunkers are excluded for countries.

Industry

Includes the mining sector, manufacturing sector, construction and public works sector. It excludes the fuel consumption of all modes of transport, even those used by industry, and also excludes energy products employed for non energy uses (e.g. raw materials, lubricants). It also excludes the fuel input for autoproduction and includes the autoproduced electricit.

Transport

Includes all modes of transportation (ISIC Divisions 49 to 51), regardless of to whom they belong, and to what purpose the transport serves. Aviation and marine bunkers (international aviation and sea transport) are excluded, except at the world level.

Residential/Commercial

Final consumption of energy products used for energy uses, excluding industry, transport, and agriculture sectors. ISIC Divisions 33, 36-39, 45-47, 53, 55, 56, 58-66, 68-75, 77-82, 84 [excluding class 8422], 85-88, 90-96 and 99 [for tertiary], and 97 and 98 [for residential].

CO₂ Emissions

Emissions from combustion of mainly fossil fuels, estimated using the IPCC Reference Approach.

CO₂ Intensity

Amount of CO₂ emitted to produce one unit of Gross Domestic Product (GDP). In this publication it is measured in terms of purchasing power parity (ppp).

Primary Energy Intensity

Primary energy consumption necessary to produce one unit of Gross Domestic Product (GDP). Non energy uses are excluded. In this publication it is measured in terms of purchasing power parities (ppp).

Final Energy Intensity

Final energy consumption necessary to produce one unit of Gross Domestic Product (GDP). Non energy uses are excluded. In this publication it is measured in terms of purchasing power parities (ppp) it is measured in terms of purchasing power parity (ppp).

Geographical grouping

European Union (EU27)

Austria, Belgium, Bulgaria, Croatia, Cyprus, Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, Netherlands, Poland, Portugal, Romania, Slovakia, Slovenia, Spain, Sweden.

OECD

Australia, Austria, Belgium, Canada, Chile, Colombia, Costa Rica, Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Israel, Italy, Japan, Latvia, Lithuania, Luxembourg, Mexico, Netherlands, New Zealand, Norway, Poland, Portugal, South Korea, Slovakia, Slovenia, Spain, Sweden, Switzerland, Turkey, United Kingdom, United States.

OPEC

Algeria, Angola, Ecuador, Equatorial Guinea, Gabon, Iran, Iraq, Kuwait, Libya, Nigeria, the Republic of the Congo, Saudi Arabia, United Arab Emirates, Venezuela.
